Vodavi offers two voice processing solutions for the STARPLUS STS System. This guide will help you steer your customers in the right direction in choosing the appropriate system for their organization.

STARPLUS STS In-Skin Flash Voice Mail Card

Designed for small office/home office applications, this is a great entry-level voice mail system that will allow users to reap the benefits of voice messaging with very little investment.

STARPLUS STS In-Skin HDD Voice Mail Card

For a more robust feature set and larger message storage capacity, this HDD-based voice mail card is perfect for the medium-sized business needing advanced message notification options, sophisticated call routing or for businesses requiring message storage and retrieval over long periods of time.

Both of these in-skin voice mail systems have a unique feature in that they do not detract from the KSU port count.
